AIS – AURELIA INDUSTRIAL SYSTEMS

ORGANIZATIONAL STRUCTURE

Aurelia Industrial Systems (AIS)
Organizational Structure

Document ID: AIS-CORP-002
Version: 1.0
Effective Date: January 5, 2026
Category: Company Documentation
Language: English
Classification: Internal

---

1. Purpose

This document describes the organizational structure of Aurelia Industrial Systems and defines the primary responsibilities of the company's departments.

The document also describes the internal escalation model used for customer requests and technical incidents.

---

2. Executive Management

Executive Management is responsible for the overall strategic direction and governance of AIS.

Responsibilities include:

- Company strategy
- Business planning
- Major customer relationships
- Corporate governance
- Financial oversight
- Risk management
- Approval of major operational decisions

Executive Management does not normally handle individual technical-support requests directly.

---

3. Sales Department

The Sales Department manages commercial relationships with customers and prospects.

Responsibilities include:

- Customer relationships
- Product quotations
- Commercial proposals
- Contract negotiation
- Commercial terms
- Product availability discussions
- New customer acquisition
- Account management

Commercial requests concerning contracts, quotes, pricing, or commercial conditions should normally be routed to Sales.

---

4. Customer Support Department

Customer Support is the primary operational entry point for customer requests.

Responsibilities include:

- Receiving customer requests
- Creating support tickets
- Initial ticket classification
- Priority assignment
- SLA monitoring
- Customer communication
- Coordination between departments

- Escalation management
- Ticket closure

Customer Support may escalate a request to Technical Support, Engineering, Logistics, Finance, or IT & Security depending on the nature of the issue.

---

5. Technical Support Department

Technical Support handles product and machine-related technical problems.

Responsibilities include:

- Machine diagnostics
- Error-code analysis
- Troubleshooting
- Remote diagnostics
- Technical instructions
- Corrective-action recommendations
- Technical ticket investigation
- Coordination of field-service interventions

Technical Support should not independently modify engineering designs or product specifications.

Issues requiring product-level engineering analysis must be escalated to Engineering.

---

6. Engineering Department

Engineering is responsible for product engineering and complex technical analysis.

Responsibilities include:

- Product design
- Machine architecture
- Software and PLC engineering
- Hardware engineering

- Product modifications
- Complex technical investigations
- Root-cause analysis
- Engineering change management
- Product technical documentation

Engineering involvement may be required when Technical Support cannot resolve a recurring or complex technical problem.

---

7. Logistics Department

The Logistics Department manages physical product and spare-parts movement.

Responsibilities include:

- Order fulfillment
- Warehouse coordination
- Spare-parts logistics
- Shipment preparation
- Carrier coordination
- Delivery tracking
- Shipping-related investigations

Shipping delays should normally be escalated to Logistics after the relevant order and shipment information has been verified.

---

8. Finance Department

Finance manages financial and administrative activities.

Responsibilities include:

- Invoicing
- Payment processing
- Credit management

- Financial records
- Billing inquiries
- Customer account administration

Billing-related requests should not be handled as technical-support incidents unless they also contain a separate technical issue.

---

9. IT & Security Department

IT & Security is responsible for company technology infrastructure and information security.

Responsibilities include:

- Identity management
- Authentication systems
- Authorization infrastructure
- Infrastructure security
- Security monitoring
- Security incident response
- Internal applications
- Network security
- Access management

Security incidents must be escalated to IT & Security.

Examples include:

- Suspected credential compromise
- Unauthorized access
- Data exposure
- Malicious requests
- Suspicious authentication activity
- Security-control failures

10. Department Responsibilities

Department	Primary responsibility
Executive Management	Strategy and governance
Sales	Commercial relationships and contracts
Customer Support	Customer requests and ticket coordination
Technical Support	Technical diagnosis and assistance
Engineering	Product engineering and complex technical analysis
Logistics	Orders, shipments, and spare parts
Finance	Billing and financial administration
IT & Security	Infrastructure, identity, access, and security

---

11. Customer Support Escalation

The standard escalation path is:

Customer → Customer Support → Specialized Department

Depending on the request:

Technical Issue

Customer
→ Customer Support
→ Technical Support
→ Engineering if required

Shipping Issue

Customer
→ Customer Support
→ Logistics

Billing Issue

Customer
→ Customer Support
→ Finance

Security Issue

Customer
→ Customer Support
→ IT & Security

Commercial Issue

Customer
→ Customer Support
→ Sales

---

12. Technical Escalation

Technical issues should normally follow the sequence below.

Level 1 — Customer Support

Customer Support verifies:

- Customer identity
- Machine information
- Ticket details
- Priority
- Basic troubleshooting information

Level 2 — Technical Support

Technical Support performs:

- Error-code analysis
- Diagnostic procedures
- Remote analysis
- Technical recommendations

Level 3 — Engineering

Engineering is involved when:

- The standard troubleshooting procedure fails.
- The problem indicates a possible product defect.
- Product-level analysis is required.
- A design modification may be necessary.
- A recurring technical issue requires root-cause investigation.

---

13. Security and Authorization

AIS systems distinguish between **authentication** and **authorization**.

Authentication determines the identity of the user.

Authorization determines which resources and operations that user is permitted to access.

For example, a customer user may be authenticated successfully but still be unauthorized to access another customer's orders.

The AI support assistant must follow the same principle.

The AI assistant may determine the user's intent and select an appropriate tool, but authorization must be enforced by the application and tool layer.

An LLM response must never be considered proof that a user has permission to access a resource.

---

14. Customer Support Platform Roles

The AIS customer-support platform defines three primary roles.

CUSTOMER

Customer users can access information belonging to their own customer organization, subject to system permissions.

Typical resources include:

- Own machines
- Own orders
- Own shipments

- Own support tickets

SUPPORT_AGENT

Support agents can access customer-support information required to perform their operational responsibilities, according to assigned permissions and scope.

ADMIN

Administrators can perform controlled system-administration operations.

Administrative privileges must be used only when required.

---

15. Example Organizational Scenario

A customer reports that an AIS-200 machine displays error E-204 and production has stopped.

Customer Support creates a ticket and classifies the incident according to the Customer Support Policy.

Because the machine is reporting a technical error, Customer Support escalates the incident to Technical Support.

Technical Support checks the troubleshooting documentation and determines that E-204 relates to the cooling system.

If the approved operator-level checks do not resolve the problem, Technical Support may escalate the issue to Engineering or request a field-service intervention.

If the incident is production-stopping and meets the P1 definition, the applicable critical-incident process must be followed.

---
